

INSTRUCTION SHEET

Thank you for participating in this study!

Below is a description of the procedure of this study and the tasks you are required to do.

Location of the study: Online.

Duration of the study: 2 hours.

Procedure of the study:

Imagine you are planning to develop a new time and task management app to help people organise their daily activities. To make your product competitive, it's essential to analyse similar apps in the market, along with user behaviours and reviews.

However, data quality plays a major role in how much we can trust such analysis – and research shows it often doesn't get enough attention from software engineers.

In this study, you will review a dataset of app reviews for time management and productivity applications collected from the Google Play Store. Your task is to assess the data quality of this dataset and report any issues you identify.

Please follow the steps below to complete the study.

1. Please download, read, and sign the consent form.
2. Download the attached dataset and open it using MS Excel.
3. Start reviewing the quality of the data and remember, MS Excel is a powerful tool for statistical analysis.
4. All identified data quality issues must be reported in this form.
5. Kindly record your start and finish timestamps, as they will be needed for later analysis.
6. Once you are done, please fill out this survey. It will be followed by a short interview with you for 8-10 minutes.

By completing the above steps, you are free to go.

We highly appreciate your participation and collaboration with us.
